Crab LogPar parameter uncertainties

Controlled comparison: same 44 selected cells; 1D collapses E_{pred} within each N_{hit} bin

Parameter uncertainty	1D N_{hit}	2D $N_{\mathrm{hit}} \times E_{\mathrm{pred}}$	Reduction
Normalization σ_{ϕ_0}	4.318×10^{-14}	3.461×10^{-14}	**19.8%**
Spectral index σ_α	0.02317	**0.02048**	**11.6%**
Curvature σ_β	0.01693	**0.01358**	**19.8%**

Formal HESSE 1σ uncertainties at pivot energy $E_0 = 3$ TeV. ϕ_0 uncertainty unit: TeV^{-1} cm^{-2} s^{-1}.
Lower uncertainty is better; this table quantifies formal statistical precision, not bias or systematic uncertainty.
